PRESENTATION OF THE PROGRAM

1. Information about the course of study

The uniform second-level Master's degree study of Medicine lasts six years (12 semesters) and consists of a total of 360 credit points.

2. The basic objective of the program and obtained competences

The essential goal of the uniform Master's study program of Medicine is to train an expert to perform professional duties and tasks in the field of medicine, and also give him a sound basis for further professional training in the field of specializations and/or continuing the study onto the PhD level.

General competencies

- Ability to analyze, synthesize and envisage solutions and consequences,
- mastery of research methods, procedures and processes, development of critical and self-critical judgement,
- ability to apply knowledge in practice,
- autonomy in professional work,
- development of communication abilities and skills,
- ethical reflection and commitment to professional ethics,
- cooperativeness, teamwork, and working in an international environment.

Subject-specific competencies

- Knowledge and understanding of the role and development of medicine,
- the ability to solve specific work problems using scientific methods and procedures,
- specific mastery of basic knowledge, and the ability to integrate knowledge from different fields and its use,
- the ability to include new information and interpretations in the context of medicine,
- understanding the general structure of medicine and the connection between its sub-disciplines,
- understanding and use of methods of critical analysis, development theories and their usage in solving specific work problems,
- development of skills and abilities in the use of knowledge in the field of medicine,
- use of information and communication technologies and systems in the field of medicine.

Medicine-specific competencies

- Knowledge of the molecular basis and mechanisms of normal and pathological functioning of the human organism,
- knowledge of normal and pathological structures on the cellular level and on the level of human organism,
- knowledge of basic biological, behavioral and social factors of health and disease development,
- understanding of the place and role of medicine in society,
- communication skills with patients,
- knowledge of public health problems treatment methods,
- knowledge of patient care basic principles,
- the ability to examine a patient,
- knowledge of the role of environment in the emergence and development of diseases,
- understanding of disease states, their signs and symptoms,
- knowledge of the role of lifestyle on the formation and evolution of diseases,
- knowledge of disease diagnostics and disease treatment,
- knowledge of preventing diseases and their rehabilitation,
- integration of knowledge and skills at work with a patient in a hospital, clinic or at home,
- scientific research in the field of medicine

3. Curriculum evaluation and credit requirements according to ECTS

See Annexes 1 and 2.

4. Conditions and requirements for enrolment

In the Uniform second-level Master's degree of Medicine may be enrolled:

- a. those that have passed the general Matura exam,
- b. those who have completed any four-year secondary school program before June 1st 1995.

All applicants must demonstrate their knowledge of Slovenian at level B2 of the Common European Framework of Reference for Languages (CEFR) by means of the relevant certificate.

Relevant proof of compliance for this entry condition shall be:

- a pass certificate from an examination of the Slovenian language at B2 level, approved by the Slovenian Language Examination Centres, certified by ALTE
- a Republic of Slovenia elementary school certificate of completion, or completion from a foreign elementary school where Slovenian was a taught language,
- a high school graduation certificate or a certificate of completion of the final year of a high school vocational program in which one completed subject was Slovenian,
- a certificate of completion in bilingual high school education (Slovenian and a foreign language) or completion from a foreign high school institution where Slovenian was a taught language,
- a diploma of acquired education in a study program from a higher education institution in the Republic of Slovenia, and a certificate (statement) that the candidate completed the program in the Slovenian language.

Candidates who undertake (have undertaken) a general high school examination in the Republic of Slovenia need not send proof of knowledge in the Slovenian language, the required information is submitted to the higher education and information service by the State Examination Centre.

In the case of limited enrolment, the applicants under a) will be selected according to:

- the general grade in the general maturity examination, 30 % of points
- the general grade in third and fourth year, 10 % of points
- success in individual subjects of the general maturity examination:
mathematics, a foreign language and one natural science subject
(biology, physics or chemistry). 60 % of points

Candidates under point b), by:

- the general grade in the final examination, 30 % of points
- the general grade in third and fourth year, 10 % of points
- grade in mathematics or a foreign language in the final examination
and grade from one of the natural science subjects (physics, chemistry
or biology) in the final exam or in the last year of secondary school,
when the subject was taught. 60 % of points

5. Criteria for recognition of knowledge and skills acquired prior to enrolment in the program

UL MF recognizes acquired knowledge, qualifications or abilities to candidates only in case when this knowledge is acquired in formal forms of education, when candidates transfer to UL MF from other medical study programs. The recognition process is led by the Commission for Student Affairs individually for each candidate. On the basis of the reports of the course lecturers, the Commission

identifies differences in the program and recognizes only formally acquired knowledge that corresponds to the general or subject-specific competencies defined in the uniform Master's study program of Medicine.

6. Evaluation method

Evaluation method is specified in Regulations for assessment of knowledge and skills for the uniform master's study programs of medicine and dental medicine, which is available on the website of Medical Faculty.

Final grades for the course exams are as follows:

- 10 – (excellent: exceptional knowledge without or with negligible faults),
- 9 – (very good: very good knowledge with some minor faults),
- 8 – (very good: good knowledge with certain faults),
- 7 – (good: solid knowledge but with several faults),
- 6 – (satisfactory: knowledge only meets minimal criteria),
- 5 – (unsatisfactory: knowledge does not meet minimal standards).

For visiting students, the obtained grades are converted into the ECTS system:

- A – excellent (10),
- B – very good (9),
- C – good (8),
- D – satisfactory (7),
- E – sufficient (6),
- F – insufficient (5),

7. The requirements for advancement in the program

The requirements for a advancement in the program are distinctly specified in the document called »Pravila študija UL Medicinske fakultete za Enovita magistrska študijska programa 2. stopnje Medicina in Dentalna medicina«. A student of the Uniform second-level Master's study programme of Medicine who enrolled into the first year of study in the academic year 2017/2018 or later, may progress to the next year if he fulfils the requirements defined in the program. To advance to the next year of study, the student must collect at least 54 credit points from the current year of study with passed exams in subjects, which are necessary for a successful work in the next year of study.

7.1. The requirements for advancement in the program

From the 1st to the 2nd year of study: 54 credit points.

From the 2nd to the 3rd year of study: 54 credit points from the 2nd year of study and passed all exams in the 1st year of study.

From the 3rd to the 4th year of study: 54 credit points from the 3rd year of study and passed all exams in the 1st and 2nd year of study.

From the 4th to the 5th year of study: 54 credit points from the 4th year of study and passed all exams in the 1st, 2nd and 3rd year of study.

From the 5th to the 6th year of study: 54 credit points from the 5th year of study, passed all exams in the 1st, 2nd, 3rd and 4th year of study and passed the following exams at subjects in the 5th year of study: General paediatrics, Ophthalmology and Otorhinolaryngology.

7.2 Advancement in the program—exceptional advancement to the next year of study

A student of the Uniform second-level Master's degree study of Medicine may progress exceptional to the next year of study—exceptional advancement to the next year of study, even if he fails to meet conditions (54 credit points) if he:

- has justifiable and sufficient reasons,
- has collected at least 46 credit points with passed exams in subjects from the current year of study and has:
 - From the 2nd to the 3rd year of study: passed all exams in the 1st year of study.
 - From the 3rd to the 4th year of study: passed all exams in the 1st and 2nd year of study.
 - From the 4th to the 5th year of study: passed all exams in the 1st, 2nd and 3rd year of study.
 - From the 5th to the 6th year of study: passed all exams in the 1st, 2nd, 3rd and 4th year of study.

7.3 Terms for repetition of a year

A student who has not completed the requirements for advancing to the next year can re-enter a year of study once during the period of study if he has fulfilled at least half of the requirements from the current year of study (30 credit points) and has during the period of study not yet changed the study program or study course.

The Commission for Student Affairs may exceptionally permit enrolment of a student who does not meet the conditions for re-enrolment (exceptional extension of a student status), if the statutory requirements were not met because of the justifiable reasons, which are defined in the document »Pravila študija UL Medicinske fakultete za Enovita magistrska študijska programa 2. stopnje Medicina in Dentalna medicina«.

8. Transitions between study programs

According to the Criteria for transfers between study programs, the Senate of the Faculty of Medicine defines the number of available places for continuation of study for each year. The terms and number of available places are published in Call for enrolment.

Transition is understood as termination of studies in one study program and continuation of studies in a new study program on the Faculty of Medicine—Uniform second-level Master's degree study of Medicine.

An applicant who would like to switch between the programmes Uniform Master's program in Medicine/Dental Medicine, must apply via the eVŠ portal in accordance with the entry requirements valid for that particular year. All the applications are processed by the Commission for Study Affairs at the Faculty of Medicine, University of Ljubljana. If the number of candidates exceeds the number of available places, the applicants are assessed using previous academic record at the institution from which they would like to transfer.

Transitions between study programs are possible:

1. if both study programs ensure a acquisition of comparable competences after their completion,
2. if it is possible to acknowledge at least half of the obligations from the first study program under the European Credit Transfer and Accumulation System (hereinafter: ECTS), which are similar to the obligatory courses of the second study program.

The transition from other study programs to the uniform Master's study program of Medicine is possible to the second or third year of study. The candidate must fulfil the requirements for enrolment in to the first year of study regarding the knowledge of the Slovenian language. He must have also passed the general maturity examination, successfully completed the first or the first two years of his current study program (he must have gained 60 credit points for each year of study) and have an average grade of at least 8,5.

The Commission for Student Affairs checks the number of credit points and average grade of the 1st year of study or 1st and 2nd year of the medicine study for candidates who requests for an advancement to the 2nd or 3rd year of study, according to the Criteria for transfers between study programs.

The number of (ECTS) credits and average grades for the 1st year students who advance to the second study year of Uniform Master's program in Medicine are evaluated by The Commission for Study Affairs. The (ECTS) credits and average grades for the 1st and 2nd year students who advance to the third study year of Uniform Master's program in Medicine are assessed by the Commission for Study Affairs (according to the criteria for transitions). The average grade of the 1st or 1st and 2nd year is calculated as the average of all numerical grades obtained by the candidate in the subjects of the 1st year (when transitioning to the 2nd year) or 1st and 2nd year (when transitioning to the 3rd year) at the parent educational institution (the institution from which he wishes to transfer to Faculty of Medicine). Descriptive grades are not included in the calculation of the grade point average.

The Commission for Student Affairs defines bridging examination for the subjects, which differ from the study program of the uniform Master's study program of Medicine. Potential differential exams in subjects that differ from the Uniform Master's program in Medicine can also be determined.

Transition is possible if the candidate meets the general requirements for enrolment in accordance with the Higher Education Act of the Republic of Slovenia and the uniform Master's study program of Medicine.

The application for the transition between study programs of medicine or dental medicine must be accompanied by photocopies (report cards from 3rd and 4th years of high school, general certificate of high school education with a report card for the general high school examination and a certificate of passed examinations in a previous course of medicine or dental medicine, including the course of study—for the latter two the document must include information on the scope of the subjects and assessments of completed exams according to ECTS).

Transition between study programs is possible only in the case of a favorably resolved application and only in accordance with the conditions published in the Call for Enrollment.

9. The mode of study

The Uniform second-level Master's degree study of Medicine is available to study as full-time study program.

10. Conditions for completing the program

A student completes his study program and graduates when he completes all obligations of the study program and achieves 360 credit points.

11. Field of study program according to the classification KLASIUS and scientific discipline according to the Field of Science and Technology classification FRASCATI

The Uniform second-level Master's degree study of Medicine is classified on classification KLASIUS:
On the first classification level KLASIUS-P-16, the study program is classified under field Health and Welfare.
On the second classification level KLASIUS-P-16, the study program is classified under field Health.
On the third classification level KLASIUS-P-16, the study program is classified under field Medicine.

1ST LEVEL 09

2ND LEVEL 091

3RD LEVEL 0912

The study program is according to the classification FRASCATI classified under Medical Sciences, which include subgroups Basic Medicine, Clinical Medicine and Public Health.

12. Classification within the Slovenian Qualifications Framework, Framework for Qualifications of the European Higher Education Area and European Qualifications Framework

Slovenian Qualifications Framework /SQF/: level 8

13. Professional title acquired with completing the program

The professional title acquired by the graduate is *Doctor of Medicine (M.D.)*.

Elective subjects in 2 nd year of study										
Seq. No.	Subject	Lecturer	Contact hours					SIW	Total hours	ECTS credits
			L	S	PPC	CPC	OFS			
1.	Research in Medicine	All lecturers of the programme		10			5	75	90	3
2.	Selected Themes in Physiology	K. Cankar, Ž. FINDERLE, H. Lenasi, N. Potočnik		20			25	45	90	3
3.	Selected Topics in Functional and Clinically Applicative Histology and Anatomy	Danijel Petrovič, Erika Cvetko, Katarina Šurlan Popović, Nejc Umek	5	30	10			45	90	6
4.	Selected chapters in Immunology	Alojz Ihan	15	15	15			45	90	3
5.	Selected topics in public health	Barbara Artnik Andreja Kucec	10	10			25	45	90	3
6.	Selected topics of clinical medicine 2	J. Brguljan Hitij, V. Homar, M. Moharič, D. Petek, M. Rus Makovec	15	15			15	45	90	3
7.	Selected Topics in Medical Biochemistry	N. Debeljak, V. Dolžan, P. Hudler	15	15			15	45	90	3
8.	Selected Topics in Medical Molecular Genetics	Vita Dolžan	15	15			15	45	90	3
9.	Selected themes in the Structure and function of the nervous system	K. Cankar, I. Cilenšek, E. Cvetko, Ž. FINDERLE, H. Lenasi, M. Meznarič, A. Milutinović Živin, D. Petrovič, R. Zorc Pleskovič, Nejc Umek		15	15		15	45	90	3
10.	Selected topics in medical research 2	K. Geršak, M. Pohar Perme, D. Rozman	5	20	20			45	90	3
11.	Research work for the Prešeren student award	All lecturers of the programme		20			5	155	180	6
12.	Sports and healthy lifestyle of students	Tomaž Marš, Matej Majerič	5		45			40	90	3

Elective subjects in 3 rd year of study										
Seq. No.	Subject	Lecturer	Contact hours					SIW	Total hours	ECTS credits
			L	S	PPC	CPC	OFS			
1.	Selected Topics in Pathology	Margareta Strojan Fležar	15	5	23	2		45	90	3
2.	Selected topics in diagnostics	P. Popović, V. Salapura, K. Šurlan Popović, K. Trebušak Podkrajšek	25	20				45	90	3
3.	Selected Topics in Pharmacology	Katarina Černe, Mojca Kržan, Metoda Lipnik Štangelj		45				45	90	3
4.	Selected Topics of Clinical Medicine 3	J. Brguljan Hitij, U. Golobič Ahčan, P. Građšek, N. Kopčavar Guček, M. Košnik, D. Petek, M. Petek Šter, T. Pintar, D. Pongrac Barlovič, M. Snoj	15	15			15	45	90	3
5.	Selected Topics in Microbiology	A. Ihan, T. Matos, P. Maver Vodičar, M. Petrovec, M. Pirš, E. Ružič Sabljic, K. Seme, B. Šoba Šparl, A. Šterbenc Železnik	15	15			15	45	90	3
6.	Selected Pathophysiology Topics	F. Bajrovič, M. Bresjanac, H. Chowdhury, U. Kovačič, T. Marš, S. Pirkmajer, S. Ribarič, D. Šuput, N. Vardjan, R. Zorec, M. Živin	10	35				45	90	3
7.	Selected Topics in Research in Medicine 3	A. Blinc, J. Buturovič-Ponikvar, Š. Grosek, U. Grošelj, M. Ovsenik, M. Pohar Perme, L.- Zaletel Kragelj	13	16			16	45	90	3
8.	Research in medicine	All lecturers of the programme		10			5	75	90	3
9.	Research work for the Prešeren student award	All lecturers of the programme		20			5	155	180	6
10.	Sports and healthy lifestyle of students	Tomaž Marš, Matej Majerič	5		45			40	90	3

Elective subjects in 4 th year of study										
Seq. No.	Subject	Lecturer	Contact hours					SIW	Total hours	ECTS credits
			L	S	PPC	CPC	OFS			
1.	Selected topics in psychiatry	Bojan Zalar	15	15	15			45	90	3
2.	Selected topics in dermatovenerology	Mateja Dolenc Voljč, Tomaž Lunder	15	30				45	90	3
3.	Selected topics in Respiratory Medicine	Matevž Harlander, Sabina Škrbat, Tomaž Štupnik		20	5	20		45	90	3
4.	Selected topics in infectious diseases and global health	Janez Tomažič	15	5	5	10	10	45	90	3
5.	Selected Topics in Neurology	Zvezdan Pirtošek	10	20		15		45	90	3
6.	Selected topics in Cardiovascular Medicine	Borut Jug, Gregor Poglajen, Katja Prokšelj, Dušan Štajer	15	5	5	10	10	45	90	3
7.	Selected Topics in Gastrointestinal System	Borut Štabuc	15	10		20		45	90	3
8.	Selected topics in Urinary Tract	Simon Hawlina, Andreja Marn Pernat, Tomaž Smrkolj, Željka Večerić-Haler	15	10	5	12	3	45	90	3
9.	Research work for the Prešern student award	Vsi nosilci v programu		20			5	155	180	6
10.	Research in Medicine	Vsi nosilci v programu		10			5	75	90	3
11.	Sports and healthy lifestyle of students	Tomaž Marš, Matej Majerič	5		45			40	90	3

Elective subjects in 5 th year of study										
Seq. No.	Subject *the subject is carried out in the winter and summer semester	Lecturer	Contact hours					SIW	Total hours	ECTS credits
			L	S	PPC	CPC	OFS			
1.	Tropical and travel medicine *	Tadeja Kotar	5		45			40	180	6
2.	Selected topics in haematology *	Matevž Škerget		20	10	15		45	90	3
3.	Selected topics in immune and rheumatic diseases *	Alojz Ihan, Katja Perdan Pirkmajer, Mihela Zidarn	20	15	5	5		45	90	3
4.	Selected topics in Endocrinology *	Tomaž Kocjan, Vilma Urbančič Rovan	20	15		10		45	90	3
5.	Selected topics in Gynaecology and Obstetrics *	Špela Smrkolj	15	30				45	90	3
6.	Selected topics in orthopaedics and traumatology *	Matej Drobnič	15			30		45	90	3
7.	Selected topics in physical and rehabilitation medicine *	Metka Mohorič		30		15		45	90	3
8.	Selected topics in Occupational Medicine *	Alenka Franko	15	30				45	90	3
9.	Selected topics in ophthalmology *	Polona Jaki Mekjavič	1	44				45	90	3
10.	Selected topics in otorhinolaryngology*	Saba Battelino	1	44				45	90	3
11.	Selected topics in Forensic Medicine *	Tomaž Županc	10	35				45	90	3
12.	Selected topics in Oncology *	Boštjan Šeruga	6	39				45	90	3
13.	Selected topics in Clinical Nutrition *	Nada Rotovnik Kozjek	30	10		5		45	90	3
14.	Selected topics in geriatrics and palliative medicine *	Mišo Šabovič	10	15		20		45	90	3
15.	Selected topics in maxillo- facial surgery *	Nataša Ihan Hren		15		30		45	90	3
16.	Research in Medicine *	All lecturers of the programme		10			5	75	90	3
17.	Research work for the Prešeren Award	All lecturers of the programme		20			5	155	180	6
18.	Sport and healthy lifestyles for students	Matej Majerič, Tomaž Marš	5		45			40	90	3

Elective subjects in 6 th year of study (the subjects are carried out in the 11 th semester)										
Seq. No.	Subject	Lecturer	Contact hours					SIW	Total hours	ECTS credits

5.	Tropical and travel medicine *	Tadeja Kotar	84	20	10	10	24	32	180	6
6.	Sport and healthy lifestyles for students	Matej Majerič, Tomaž Marš	5		45			40	90	3
7.	Selected Topics in Anesthesiology	Iztok Potočnik	20			25		45	90	3
8.	Selected Topics in Family Medicine	Marija Petek Šter	5	20		20		45	90	3
9.	Selected Topics in Internal Medicine	Aleš Blinc, Mitja Košnik, Zlatko Fras	5	25		15		45	90	3
10.	Selected Topics in Surgery	Jan Grosek, Simon Hawlina	10	35				45	90	3
11.	Selected Topics in Paediatrics	Tadej Battelino	10	5		30		45	90	3
12.	Research in medicine	All lecturers of the programme		10			5	75	90	3
13.	Research work for the Prešeren Award	All lecturers of the programme		20			5	155	180	6
14.	Physician as a profession	Eva Cedilnik Gorup Jadranka Buturovič-Ponikvar Lijana Zaletel Kragelj Štefan Grosek	10	15	20			45	90	3

Annex No. 2: Presentation of individual subjects

Anatomy (14 ECTS)

Aims

Anatomy will be approached from a functional perspective, with particular emphasis on the clinical anatomy of the adult. At clinically relevant body parts, the student will get the knowledge about the anatomy of a child and adolescent and also about woman's anatomy in pregnancy. The student will be qualified to find and identify those anatomical structures on or in the chest, abdomen and limbs which he will encounter later on at daily clinical work. He will become familiar with clinically significant variations, which could significantly affect the establishment of clinical diagnosis and treatment. On extremities, he will get to know the mechanics of joint motion, he will be able to demonstrate it and to understand its purpose in clinical investigation.

Contents

Upper extremity: Osteology. Functional anatomy of joints and muscles. Spinal nerve, brachial plexus and peripheral nerves. Superficial and deep vessels and lymph nodes. Topographical regions.

Lower extremity: Osteology. Functional anatomy of joints and muscles. Lumbosacral and pudendal plexuses and peripheral nerves. Superficial and deep vessels and lymph nodes. Topographical regions.

Thorax: Osteology. Functional anatomy of joints and muscles. Diaphragm. Mammary gland. Esophagus, trachea, bronchial tree and lung. Pleura. Heart: chambers, valves, blood vessels, innervation. Pericardium. Pulmonary blood system. Fetal circulatory system. Mediastinum. Lymph vessels and lymph nodes. Auscultatory points of the heart and lungs. Topographical regions.

Abdomen: Abdominal wall and inguinal canal. Stomach, duodenum, small and large intestine, rectum. Liver and pancreas, spleen. Development and situs of the organs. Peritoneum. Abdominal blood vessels. Kidney and supra renal gland, ureter, bladder. Pelvis major and minor. Male and female urethra. Female reproductive system, pregnancy. Male reproductive system, descent of the testis. Retro- and subperitoneal space. Lymph vessels and lymph nodes. Topographical regions.

Head and neck: Osteology. Topographic regions of head and neck: scalp, trigonum colli laterale, trigonum submandibulare, trigonum caroticum, retromandibular fossa, infratemporal fossa. Nasal cavity. Oral cavity and salivary glands. Pharynx. Larynx. Blood vessels, lymphatics and nerves.

Medical Biophysics (5 ECTS)

Aims

The student will get acquainted with the physical image of the world in detail. The emphasis will be on physical principles that are important for the formation of biological structures and for the functioning of biological systems. He will get to know the physical phenomena which are the basis of physiological processes. He will get acquainted with the physical fundamentals of measurement methods used in diagnostics, and the physical phenomena which some methods of treatment are based on. He will get to know the basics of certain devices used in medical practice. The student will become used to quantitative treatment of physical and other phenomena. He will be acquainted with a scientific, analytically-synthetic method of thinking.

Contents

Quantitative description of phenomena in medical sciences. Exponential change. Graph plotting, linearization. Equilibrium and motion of the body. Forces and torques in the muscles and the skeleton with examples from orthopedics and orthodontics. Energetics of motion. Molecular motors. Mechanical properties of solids. Mechanical properties of liquids: pressure, buoyancy, viscosity, surface tension, capillary action, Law of Laplace. Viscous drag. Sedimentation rate. Blood circulation, aneurysm, stenosis. Viscoelasticity. Lungs, compliance, surfactants. Periodic phenomena, vibration, natural frequencies of molecular vibrations. Laws of thermodynamic. Temperature. Calorimetry. Chemical reactions, enthalpy, entropy, free enthalpy, chemical potential. Solubility of gases and decompression sickness. Osmotic pressure. Air humidity. Transport of heat, diffusion, generalized Ohm's Law. Trans-membrane transport. Electric and magnetic properties of

matter. Dipole. Electrostatic interactions between molecules. Electric conductivity of solutions. Origins of membrane potential, Nernst equation, Goldman equation. Electric current, propagation of nerve impulses. Biological effects of electric and magnetic fields. Electrocardiography, electromyography, electroencephalography, magnetoencephalography. Structure of matter and molecular interactions. Nuclear medicine. Nuclear stability and decay. Wave phenomena, fraction, diffraction, interference, scattering. Absorption, photometry and spectroscopy, pulse oximetry. Sound and the ear. Ultrasound. Biological effects of ultrasound. Electromagnetic spectrum. Light and the properties of the eye. Laser. Optical instruments, microscope. Biological effects of electromagnetic radiation. Ionizing radiation. Biological effects of ionizing radiation and radiotherapy. Diagnostic imaging. X-ray imaging, CT, MRI, ultrasound, PET, scintigraphy.

Medical Cell Biology (7 ECTS)

Aims

The student will acquire basic knowledge about the structure and function of cells as building blocks of organisms. He will learn about the processes of cell division, differentiation and intercellular communication, principles and role of cell death, which is required knowledge for understanding of cellular basics of disease processes. He will get familiar with chromosomal abnormalities and with basics of hereditary disease transmission in terms of classical Mendelian genetics.

Contents

Biological membranes, membrane transport principles - interconnections between different transport systems, cell junctions, cell polarity, intracellular communication and signaling. Cytoskeleton and cell movement: Microtubules, actin and intermediate filaments. Abnormal cytoskeleton structure and function as the foundation of the occurrence of certain diseases. Biosynthetic secretory pathways and endomembranic system: Endoplasmic reticulum, Golgi apparatus, vesicles and intercellular transport, lysosomes and degradation of macromolecules, exocytotic and endocytotic pathways. Endocytotic pathways: Endosomes and the different pathways of macromolecules in the cell. Normal and abnormal exo- and endo-cytotic pathways. Energy conversion organelles: Mitochondria. Nucleus – genome carrier. Definition of gene, types of genes in genome. Interphase nucleus, transport in/out of nucleus, nucleolus, chromatin packing, chromosomes. Gene, chromosome and genome mutations. Epigenetic modification. Genome imprinting. Regulation of cell cycle: phases of cycle, checkpoints, signal transduction in normal and cancer cells, replication of DNA, telomeres, mitotic and meiotic cell divisions, gene recombination. Homologous recombination in meiosis and DNA repair. Nonhomologous recombination. Cell aging, cell death as a balance of cell division, necrosis and apoptosis. Mendel's law of segregation and inheritance at the cellular level, different types of inheritance, autosomal dominant and recessive inheritance, x linked (recessive and dominant) inheritance and y linked inheritance. Exceptions to Mendel's law. Mitochondrial inheritance, polygene and multifactorial inheritance. Gene polymorphism and the principles of genetics of immunity, Progenitor cells and stem cells, spermatogenesis and oogenesis. Cellular and molecular basis of fertilization, sex determination. Early stages of embryonic development.

Research in Medicine 1 (3 ECTS)

Aims

The aim of the course is to provide the student with a basic understanding of medicine as an evidence-based science that requires the incorporation of the best research evidence into the clinical knowledge, in line with unique values and circumstances of the patient. The aim is also to encourage critical thinking about science and to equip students with knowledge that will allow them to find, understand and critically evaluate professional resources, the findings of which can help in later decision-making in clinical work.

The student will gain competencies for the critical appraisal of “best research evidence” in relevant research, ranging from basic to patient-centered clinical research.

Contents

Introduction to informatics, biostatistics and evidence-based medicine. Understanding the basic steps of evidence based medicine; the principles of basic and clinical research in medicine; the ability to define a simple research problem; understanding the need for reliable quantitative information related to diagnosis, prognosis, therapy, prevention and treatment of diseases; developing the ability to search scientific literature and to critically appraise it; knowing the basic measures and graphs of descriptive statistics; knowing the basic ideas of statistical inference; the basic informatics required for studies, clinical and research work in medicine. The ability to make a basic report (select appropriate variables / indicators, display data), the ability to distinguish between science and pseudo-science in medicine, to enhance the basic literature with relevant scientific literature, to produce a basic report based on clinical data, basic understanding of basic and clinical research in medicine; the awareness of the evidence-based medicine as the scientific basis of medicine; the ability to think about the research that lead to the current clinical practice; the awareness of the role and the possibilities of informatics in studies, clinical and research work. The ability of critical thinking about medicine as science, to understand strategies for efficiently tracking down and appraising evidence (for its validity and relevance), to basically evaluate the results and search for the errors, basic ability to report on their work.

Histology and Embryology (8 ECTS)

Aims

During the course students learn about basic preclinic and clinical characteristics of histology. Histology is to be addressed from functional point of view with the special emphasis on normal histology. Students learn about major characteristics of human development. Embryology is to be addressed from functional point of view, with special emphasis on normal development and on dysfunctional development.

Contents

Epithelia and glands. Types of epithelia. Glandular epithelia. Regeneration of epithelia. Connective tissues. Cells in connective tissues. Interstitial fluid and fibres. Mesenchyme, dense and proper connective tissue. Cartilage. Adipose tissue. White and brown fat tissue. Bone. Types of ossification. Muscles. Histophysiology of muscles contraction. Peripheral and central nervous system. Neurons, neuroglia. Peripheral nerve, ganglion. Spinal cord marrow. Cerebellum. Synapses. Nerve endings. Choroid plexus. Skin. Structure and functional histology. Hair, nails, sweat glands. Mammary gland. Endocrine glands and functional histology of each of them. Thyroid gland. Parathyroid glands. Adrenal glands. Pituitary. The pineal gland. Diffuse endocrine system. Paraganglion. Blood and blood cells. Plasma. Hemopoiesis and phases of hemopoiesis. Immune and lymphatic organs. Lymph nodes. Spleen. Thymus. Tonsils. Circulatory system. Heart. Capillaries. Arterioles. Venules. Arteries. Veins. Lymph vessels. Gastrointestinal tract. Teeth. Tongue. Oral cavity. Esophagus. Stomach. Small and large intestine. Liver. Pancreas. Respiratory system. Nasal cavity. Larynx. Trachea. Lungs. Urinary system. Kidney. Ureter. Bladder. Urethra. Male reproductive system. Testis. Seminal duct. Accessory glands. Penis. Female reproductive system. Ovaries. Follicular growth. Ovulation. Oviduct. Uterus. Vagina. Sense organs. Eye. Ear. Embryology. Blastocyst formation. Embryo. Fetus. Brachial organs development. Placenta and fetal membranes development. Bone and cartilage development. Development of muscles. Skin, nails, teeth and hair development. Nervous system development. Heart development. Vessel's development. Respiratory system development. Urogenital system development. Male and female genitals development. Gastrointestinal system development. Senses development: eye, ear. Teratology. Teratogenic substances. Congenital development irregularities. Anomalies caused by genetic and environmental factors.

Introduction to Clinical Medicine 1 (8 ECTS)

Aims

The student will get to know basic ethical principles in medicine, he will recognize the importance of health for society, he will get to know basic public health concepts and approaches, he will understand the development of medicine, changing of health and disease aspects over time, he will comprehend universality, internationality and interdisciplinarity of medicine and will master the basics of information systems and information technology tools in health care.

Contents

Module 1 Set I presents lectures about national and international declarations, conventions, laws and codes with which the student will gain insight onto the physician's moral, material and criminal responsibility. Set II presents a series of 15 seminars, which will be attended in groups with the aim to study selected chapters of medical deontology in-depth and to meet with some ethical dilemmas faced by physicians in their practice. Module 2 Medicine, public health and public health medicine. Health and disease. Determinants of health. The definition of health determinants and risk factors. Overview of determinants of health. Health care. Methods of studying population health. Management of medical problems. Public health approaches and interventions. Large public health problems. Module 3 Development of medical science and practice throughout history – from ancient medicine to modern medicine. Achievements of Slovenian physicians abroad, of some foreign physicians in our country and development of organized medical associations, hospitals and health care education among Slovenes. Promoting student thinking and motivating students through seminars and excursions. Module 4 Data collection. Electronic medical records. Information systems in health care. Signals in medicine. Images in medicine. Telemedicine and telematics. Systems to support medical decision making. Information security and cryptography. Nomenclature and classification in medicine. Computer networking and the Internet as infrastructure for scientific information.

Principles of Biochemistry (9 ECTS)

Aims

Student will acquire knowledge about biomolecules in the human body and about fundamental laws and mechanisms of biochemical events that constitute the basis for understanding of life processes in healthy and disease state of human organism.

Contents

Introduction: Atoms, chemical bonds, intermolecular forces.
 Water: Structure, properties, H-bonds, hydrophobic interactions.
 Solutions: Gas solutions, colligative properties, osmotic phenomena, ionization of water, K_w , pH, electrolytes, acids and basic substances, buffers.
 Thermodynamics: Thermodynamic laws and functions, the standard state, chemical potential.
 Chemical equilibrium: Chemical, kinetic and thermodynamic aspects; solubility product; coupled reactions and ATP, transport.
 Oxidoreduction: Quantitative characterization, photosynthesis and respiration.
 Velocity of chemical reactions: Order and molecularity; theories of the velocity of chemical reactions; influences on reaction velocity; catalysis.
 Molecular basis of life: Bio-elements, ions and biomolecules.
 Carbon atom: Structure, resonance, steric properties, chemical bonds.
 Biomolecules: Isomerism; review of functional groups, mutual interactions.
 Carbohydrates: Chemistry of sugars, mono-, oligo- and polysaccharides; glycosidic bonds; detoxification in the organism; glycoproteins; cell wall; membrane characteristics; blood groups.
 Lipids: Classification, simple and complex: fatty acids, triacylglycerols, phospholipids, sphingolipids; lipoproteins, biological membranes; prostaglandins and terpenes, steroids.
 Nucleotides: Purine and pyrimidine bases, nucleosides and nucleotides, energy transfer; cyclic nucleotides.
 Nucleic acids: Classification, structure and biological role, gene, basics of DNA replication, transcription and translation; mutations; human genome, genomics, proteomics, genetic diseases.
 Vitamins: Water soluble and lipid soluble vitamins; coenzymes and prosthetic groups.

Amino acids: Structure, properties, analytics. Peptides and biogenic amines: Structure and function.

Proteins: Classification, structure, self-assembly, conformation. Fibrillar proteins: alpha-keratin, collagen and elastin. Monomeric and oligomeric proteins: myoglobin and hemoglobin. Contractile proteins: muscular and non-muscular contractile proteins; muscle contraction. Membrane proteins: erythrocyte membrane proteins;

Na^+/K^+ -ATPase; receptors, G-proteins. Enzymes: enzyme mechanisms and kinetics, regulation, classification.

Other proteins: apolipoproteins, immunoglobulins.

Functional links: From biomolecules to complex cellular structures.

Human Physiology (12 ECTS)

Aims

The student learns about the normal function of the organism. She or he acquires the basic concepts in physiology and learns the principles of measurement of physiological events. She or he is encouraged, in accordance with the concepts, to interpret the results of the measurements. The course in physiology is based on the lessons learned from biophysics, biochemistry, biology and normal morphology. It develops the ability to independently solve problems and critical thinking and encourages the habit of self-education

Contents

Physiological principles: physiology as a science, homeostasis. Transport phenomena in physiology in the body and across the cell membrane. System analysis and control in biological systems. Membrane potential. Electrical Communication (localized and propagating potentials). Skeletal muscle. Smooth muscle. Heart and circulation of blood, general description, distribution of flow, blood volume, cardiac cycle. Electrical activity of the heart. Cardiac muscle cell, cardiac energetics. Monitoring of cardiac function. Hemodynamics. Arteries and veins. Microcirculation (exchange, control). Control of cardiac output and arterial pressure. Breathing: The relationship between the structure and function. Ventilation. Mechanics of breathing. Diffusion in the lungs. Pulmonary blood flow. Transport of blood gases. Coupling of ventilation, diffusion, perfusion. Control of breathing. The kidneys and electrolyte homeostasis. Relationship between structure and function. Glomerular filtration rate and renal blood flow. Renal function tests, renal clearance. Transtubular transport, renal counter current. Handling of water, osmolality, sodium and potassium in the body. Acid-base physiology - buffers and the Davenport diagram. Kidney and regulation of pH in the body. Gastrointestinal function: gastrointestinal wall structure and its impact on function, control of the gastrointestinal tract via nerves and chemical messengers, the characteristics of the movement of digestive tract, saliva, gastric secretion, exocrine pancreas, and the importance of bile secretion, nutrient absorption in the gastrointestinal tract. Endocrinology: principles of endocrine control of secretion of hormones, methods of operation of specific groups of hormones, the relationship nervous and endocrine system. Hormones and pituitary gland, thyroid and adrenal gland, calcium and phosphate homeostasis, sex hormones, pregnancy and childbirth. Metabolism: transformation of matter and energy in the body metabolism in different physiological states of the organism, regulation of blood glucose, basal metabolism, regulation of body temperature. Nervous system: general characteristics and functions of the nervous system, The organization of the nervous system, Neural homeostasis, Synaptic transmission, The general properties of sensory systems, The somatosensory system, The physiology of pain, control of instinctive behavior, The Visual optics, Photoreception, Neurophysiology of vision, Visual psychophysics, The conduction of sound to the inner ear and transduction, The psychophysics of hearing, Vestibular apparatus, Smell and taste, The general scheme of the motor system, The motor role of spinal cord, The motor role of the brainstem, The cortical control of movement, The motor functions of the cerebellum and basal ganglia, The control of eye movements, The role of vegetative nervous system, The integrative function of the brainstem, The nervous structure and function principle of the cerebral cortex, The physiology of emotion, Speech control, Specialization of brain hemispheres, The physiological basis of learning and memory

Research in Medicine 2 (3 ECTS)

Aims

Knowledge of the objectives and types of statistical methods; understanding the basics of statistical inference; being able to adequately present statistical data and results of statistical analyses; being able to correctly interpret results of statistical analyses; being able to plan collection of empirical data and select appropriate statistical methods to analyze them; being able to understand and critically appraise statistical analyses described in technical and scientific literature.

Contents

Basic concepts of probability and statistics. Probability distributions: binomial and normal distribution. Principles and methods of graphing data. Fundamentals of parameter estimation and statistical hypothesis testing. Confidence intervals. Univariate analysis of numerical variables. Univariate analysis of categorical variables. Linear regression and correlation. Nonparametric statistical methods. Design of experiments and introduction to analysis of variance. Basic concepts on survival analysis.

Functional and Clinically Applicative Histology and Anatomy (3 ECTS)

Aims

Knowledge and understanding of the macroscopic and microscopic structural organization of the human body. The student is able to use knowledge of anatomy and histology to manage common general clinical conditions. Independently uses the knowledge, principles and facts of anatomical and histological sciences in clinical decision making.

Contents

Functional and clinically applicative macroscopic anatomy of the human body. Functional and clinically applicative radiological anatomy of the human body. Functional and clinically applicative histology.

Structure and Function of Nervous System (8 ECTS)

Aims

Students get familiar with normal structure and function of the nervous system. They acquire knowledge of basic concepts in neurophysiology and learn the principles of measurement of neurophysiological phenomena. Students are encouraged to interpret the results of the measurements in accordance with basic physiological concepts. Students develop the ability to independently solve problems, to use critical thinking and develop the habit of self-education.

Contents

Peripheral and central nervous system. Neurons, neuroglia. Peripheral nerve, ganglion. Spinal cord marrow. Cerebellum. Synapses. Nerve endings. Choroid plexus. Nervous system development and abnormalities of the nervous system development. Spinal cord with somatic and vegetative part of the spinal nerve. Brainstem and cerebral nerves. Cerebellum. Diencephalon. The cerebral cortex and nuclei of the telencephalon. Limbic lobe. Overview of sensory pathways. Overview of motor pathways. Basal ganglion connections. Connections of the cerebellum. Meninges of the central nervous system and cerebral ventricles. Arteries and veins of the central nervous system and venous sinuses. Eye. Ear. Electrophysiology of neurons. Sensory systems and motor nervous systems. The role of autonomic nervous system. The integrative function of the brainstem. The physiological basis of higher function of nervous system.

Medical Molecular Genetics (5 ECTS)

Aims

The objective is to understand medicine as a science and to acquire knowledge, skills, and competences in the field of molecular genetics, genetic technology, genetic diagnostics, medical genetics and basics of clinical genetics and gene therapy, which will enable independent use of this knowledge in further study of clinical courses and informed decision-making in clinical practice, solving of new complex problems and scientific research. The student will also acquire competencies that will enable critical and ethical decision-making regarding the use of appropriate genetic and genomic diagnostic methods and the ability for basic interpretation of the results of the main categories of genetic tests.

Contents

Molecular genetics: Maintenance and transmission of genetic information (Replication in prokaryotes and eukaryotes, DNA polymerases, Replication of nuclear and mitochondrial DNA, Replication of viral genomes, DNA damage and repair, Mutations and genetic variability). Transcription and expression of genetic information (RNA biosynthesis, Co- and post-transcriptional RNA processing, Non-coding RNA, Genetic code, Translation, Co- and post-translational protein processing). Regulation of gene expression (Levels of regulation of gene expression, Epigenetic mechanisms of regulation of gene expression). Molecular genetics of cancer. Gene technology: Principles of recombinant DNA technology, Application of recombinant DNA technology in medicine, Molecular genetics in medicine, Genomics in medicine, Gene therapy; Ethical and legal aspects of gene therapy.

Molecular genetic diagnostics: Genetic testing and molecular genetic diagnostics of monogenic and complex diseases, Sanger and NGS sequencing, Interpretation of genetic test results, Cytogenetic diagnostics, FISH, Comparative genomic hybridization on microarrays, Molecular analysis of epigenetic changes, Molecular approaches for RNA and non-coding RNA analysis; Pharmacogenetic testing and personalized medicine; Ethical and Legal Aspects of Genetic Diagnostics.

Medical genetics: From personal to public health, Principles of inheritance and human population genetics (Mendelian inheritance, linked inheritance, gene imprinting, mitochondrial inheritance, mosaicism, chimerism, penetrance, expressiveness). Basics of clinical genetics: Human chromosomal abnormalities, Genetic counseling and its ethical and legal aspects; Prenatal genetic counseling and diagnostics; Neonatal screening; Presymptomatic genetic counseling and diagnostics.

Immunology (3 ECTS)

Aims

Comprehension of fundamentals of immune system composition, characteristics of effector molecules produced by immune cells, their function and meaning for the integrity of animal organism. Interrelationship between immune system and everyday environment, importance for health and disease. Learning of methods meaningful for studying functions of immune system.

Contents

Student acquires basic knowledge of composition and function of the immune system on the level of organs, cells and molecules. Their function is explained in relevance to natural and adoptive immunity, specificity of response, importance of antibodies and cellular immunity and their participation in health and disease. Antigens, antibodies, molecular organization, expression of immunoglobulin genes, origin of diversity and interaction between antigens and antibodies are presented in detail. Further molecules of the major histocompatibility system (genetic background, molecular structure, function, regulation of expression, processing and presentation of antigen) are discussed. The students' attention is drawn to the characteristics of lymphocytes, formation of the specific lymphocyte repertoire, activation, differentiation and function. Cytokines – their structure, function, receptors and regulation are presented. There will be discussion of the phenomenon of autoimmunity, problems of transplantation, cancer and particular infections.

Introduction to Clinical Medicine 2 (9 ECTS)

Aims

The course assists the student to: be able to use knowledge and clinical skills for a team approach and patient-centered care; be able to work safely in a clinical environment; increase the ability to self-understand the processes of the latest learning of clinical medicine and the motivation to develop their abilities throughout life; develop the ability to cooperate and work in multi-professional times; be capable of empathic and holistic psychosomatic communication with patients, their owners and co-workers; develop respectful confidentiality and cultural and social diversity; be able to recognize personal limitations, take responsibility for one's own actions in seeking advice and assistance; take care of personal mental, physical and relationship health; adhere to high ethical and professional standards.

Contents

Essential clinical examination. Physician and patient, team work. Medical psychology.

Medical Biochemistry (7 ECTS)

Aims

The course aims to give the student an understanding and basic knowledge of vital processes and their regulation at the molecular level. It introduces theoretical and practical aspects of basic biochemistry and molecular biology processes. The course deals with special topics concerning the maintenance of cell constituents, body fluids and the processes involved in tissue growth and reproduction. Students will get the knowledge of basic concepts in molecular genetics that will help them to understand molecular basis of genetic disorders.

Contents

General introduction: The role of biochemistry in medicine. Intermediary metabolic pathways. General aspects of regulatory mechanisms. Fuel oxidation and generation of energy. Carbohydrates: Digestion. Cellular degradation and biosynthesis. Regulation of metabolic pathways. Clinical correlations of carbohydrate metabolism. Lipids: Digestion of lipids. Cellular degradation and synthesis of simple and complex lipids. Metabolism of cholesterol and bile acids. Metabolism of lipoproteins. Metabolism of eicosanoids. Regulation of lipid metabolism. Clinical correlations of lipid metabolism. Amino acids: Protein digestion. Intracellular protein degradation. Amino acid catabolism. Biosynthesis of nonessential amino acids and regulation. Clinical correlations of amino acids. Amino acids as precursors of various biosynthesis. Metabolism of nucleotides and its regulation. Clinical correlations of nucleotide metabolism. Molecular biology: DNA replication and repair. Biosynthesis of RNA. Co- and posttranscriptional modifications. Regulation of transcription. Genetic code. Degradation of nucleic acids. Genetic diseases. Proteins: Protein biosynthesis. Posttranslational modification. Regulation of protein biosynthesis. Biosynthesis of selected proteins. Molecular genetics: Genetics of metabolic disorders. Molecular genetics of cancer. Epigenetics. Pharmacogenetics. Principles of genetic engineering: Gene therapy. Recombinant DNA technology. DNA sequencing. Recombinant DNA techniques in medicine. Hormones: Hormone biosynthesis. Hormonal cascade system. Hormonal inactivation and degradation. Mechanisms of action. Cell signaling. Hormones in regulation of metabolic processes. Hormones and homeostasis. Tissue metabolism: Liver. Adipose tissue. Skeletal muscle. Heart muscle. Kidney. Other tissues. Metabolic interrelationships in humans.

Public Health (4 ECTS)

Aims

To understand basic public health concepts. To understand basic health determinants of social and physical environment and their impact on human health. To understand complex health determinants and their impact on human health. To understand methods of studying public health. To understand public health measures for controlling risks in social and physical environment. Understands what major public health problems are and roughly knows the biggest ones. Understands which population groups are at risk and / or vulnerable and why.

Contents

I. Basic public health concepts. II. Basic determinants of health of social and physical environment. III. Complex determinants of health. IV. Methods of studying population health. V. Public health measures. VI. major public health problems and vulnerable population groups.

Pharmacology (8 ECTS)

Aims

The student will recognize the importance of pharmacology in the context of therapy and of prevention of diseases, he will get to know and to understand the mechanisms of action of drugs, the effects of drugs on the organism and will get to know about the fate of drugs in the organism. The acquired knowledge will represent an upgrade of the knowledge of physiological and pathological processes on which therapeutic drugs have an effect.

Contents

General pharmacology: Definition of pharmacology, its relationship to other disciplines,

drugs and drug target molecules, mechanisms of drug action, concentration – effect relationship analysis, drug receptors, pharmacokinetic processes and the fate of drugs in the organism, pharmacokinetic parameters, non-clinical drug testing.

Basics of toxicology: Mechanisms of toxic effects of exogenous substances, toxicokinetics.

Clinical Biochemistry and Laboratory Diagnostics (3 ECTS)

Aims

The aim of the course is to understand medicine as a science. In doing so, the student will acquire competencies for independent use of knowledge about the biochemical and metabolic processes in the human body and related laboratory investigations enabling independent use of knowledge, principles, and facts of basic biomedical sciences in clinical decision-making.

Contents

Importance and organization of laboratory diagnostics and clinical biochemistry, Types of biological samples, Analytical methods in laboratory diagnostics., Reference values and quality assurance, Basic investigations in haematology, analysis of urine, electrolytes, nonprotein nitrogenous compounds, enzymes, acid-base balance, oxygen transport, plasma proteins, lipids, tumor markers. Basic tests to assess the function of the liver, pancreas, kidneys, thyroid, gastrointestinal tract, disturbances in carbohydrate metabolism and other inborn errors of metabolism, myocardial infarction and iron status. Point of care testing.

Clinical Microbiology (6 ECTS)

Aims

Students are familiar with basic characteristics of microbiology, immunology and parasitology. In seminar work students get additional knowledge on subjects, important for epidemiology of infectious diseases. In practical work students get acquainted with basic microbiological techniques, time necessary to obtain the results and the importance of microbiological testing.

Contents

Bacterial cell. Metabolism, bacterial reproduction, bacterial genetics, bacterial classification, spread of germs. Normal bacterial flora. Diagnostics of bacterial infections. Collection and transport of samples for bacterial examination. Disinfection and sterilization. Antibiotics and chemotherapeutics. The purpose of the use of antibiotics. Mechanisms of bacterial resistance against antibiotics. Current problems in bacterial resistance, antibiogram.

General properties of viruses. Replication of viruses. Genetics of viruses and origin of viruses. Direct and indirect methods for detection of viruses. Pathogenesis of viral infections. Viral oncogenesis. Natural antiviral resistance in immune antiviral response. Chemotherapy of viral diseases. Characteristics of fungi and mold, dimorphism. The agents of cutaneous mycosis, dermatophytes. The agents of subcutaneous and systemic fungal infections. Characteristics of parasites causing infections in humans and animals. Natural immunity. Complement system. Immune system. Antigens. Antibodies. T cell receptor and MHC molecules. Activation of lymphocytes, immune tolerance. Regulation of immune response. Immune response in microbial infections. Infections due to lowered resistance. Immunosuppression. Microbiological and immunological diagnostics in organ transplantation. Vaccines and regular vaccination program. Historical overview of microbiology.

Pathology (9 ECTS)

Aims

Students will learn etiology, basic pathogenetic mechanisms, morphologic changes (macroscopical, microscopical, ultrastructural) at cell, tissue and organ level of various disease processes, as well as diagnostic criteria and prognostic factors.

Students will also learn about the most common pathologic methods for obtaining tissue samples (biopsy, autopsy), about the basic techniques used in pathology for examination of tissue samples (basic staining methods, histochemical, immunohistochemical and molecular methods) as well as about the role of pathology in the diagnostic procedure.

Contents

Students learn about basic pathologic processes – their etiology and pathogenesis, and are

introduced to the analysis of morphological changes in diseased cells, tissues and organs with light microscopy. They familiarize with clinical pictures, basic imaging diagnostic, macroscopic and microscopic changes of the most important disease processes through clinico-pathologic study of typical cases.

The basic pathology course deals with cell injury and adaptation, inflammation, regeneration and reparation, circulatory disorders, immunopathology, neoplasms, genetic and pediatric disorders, infectious diseases, environmental and nutritional diseases.

The organ pathology course deals with the most important diseases of the cardiovascular, gastrointestinal, respiratory systems, kidney, liver, pancreas and biliary tract, central and peripheral nervous system, female genital tract and breast, musculoskeletal and hematopoietic systems.

Pathophysiology (10 ECTS)

Aims

Students obtain the ability to understand the causes and mechanisms of diseases and pathologic processes in human beings on the basis of physiological and biochemical disfunctions in the body. During practicals, seminars and problem based learning they acquire the competence to use their knowledge for understanding the signs and symptoms of diseases, their course and complications and the rational basis for prevention and treatment.

Contents

The content encompasses pathophysiology of the following diseases and processes: Changes of body temperature. Starvation. Obesity, Diabetes. Hypoglycemia. Diseases of the thyroid gland. Inborn errors of metabolism. Electric injury. Burns. Radiation disease. Disturbances of homeostasis. Cell death. Toxin actions. Inflammation. Response to stress. Free radicals and disease. Cancerogenesis and neoplastic cell. Ageing. Pathophysiology and medicine as science. Changes in body fluids composition. Dehydration. Acidosis and alkalosis. Changes in calcium and phosphorus metabolism. Renal failure and tests of renal function. Diseases of adrenal gland. Anemia. Hemorrhagic states. Thrombosis. Changes of plasma proteins. Respiratory dysfunction. Hypoxia and cyanosis. Dysfunctions due to changes of air pressure. Cough. Dyspnea. Obstructive lung diseases. Pneumothorax. Respiratory distress. Bleeding and shock. Hypertension. Hypotension. Heart failure. Arrhythmia. Cardiac valvular disease. Edema. Atherosclerosis and plasma lipids. Complications of blood transfusion. Ischemic muscle necrosis. Liver diseases and liver tests. Pathobiochemistry of alcoholism. Peptic ulcer disease. Disturbances of gastrointestinal function. Dysfunction of neuromuscular transmission. Organophosphate poisoning. Disturbances of consciousness. Dysfunction of locomotion and paralysis. Drug addiction. Pathologic pain. Headache. Increased intracranial pressure. Dysfunctions of basal ganglia. Psychic and psychosomatic diseases. Dementia. Stroke.

Clinical Medicine (12 ECTS)

Aims

The course assists the student to: be able to use knowledge and clinical skills to manage common general clinical conditions, be competent to manage life threatening conditions, be able to work safely in a clinical environment; be curious, motivated for life-long learning of clinical medicine and motivated for professional development; understand the concept of interprofessional collaboration, develop the ability to cooperate and work in multi-professional teams, be capable of empathic and holistic psychosomatic communication with patients, their relatives and co-workers; make decisions according to ethics and evidence-based medicine, be able to recognize personal limitations, take responsibility for his/her actions in seeking advice and assistance; adhere to high ethical and professional standards.

Contents

Special clinical examination and clinical skills, Advanced life support and emergencies, Introduction to surgery, Interprofessional collaboration

Research in medicine 3 (3 ECTS)

Aims

To build upon the knowledge gained in the first two years and be able to transfer the gained competences to critical appraisal of the literature and active research. Student gets an insight into the theory and practice of modern biomedical technologies and approaches.

She/he learns the importance of bioinformatics for storing and analysis the large amount of data arising from post-genome technologies as well as image analyses.

Contents

Methods in research, Technology in medicine

Radiology and diagnostic imaging (3 ECTS)

Aims

The course aims to understand radiological and nuclear medicine diagnostic and therapeutic methods as essential in clinical medicine. The student will acquire competencies for the independent use of radiological anatomy and indications for diagnostic and treatment methods. The student will learn the essential radiological characteristics of the most common disease states, which they will use in clinical decision-making.

Contents

Importance and organization of radiology and nuclear medicine, Radiological diagnostic methods, Radiological invasive diagnostic and therapeutic methods, Nuclear medicine diagnostic and therapeutic methods, Radiological anatomy, Radiological and other imaging signs of the most common clinical conditions, Point of care diagnostic.

Nervous System (9 ECTS)

Aims

The student will develop the ability to gradually make a diagnosis of neurological disease on the basis of anamnestic data, physical examination, laboratory investigation, imaging data and other methods. He will become able to autonomously provide the emergency medical aid in neurological patients. He will master current methods of treatment and rehabilitation. He will get acquainted with possible future development of treatment and rehabilitation methods. He will acquire holistic understanding of neurological diseases and will become able to recognize the influence of these diseases on the entire organism, also in the psychosocial terms. On the other hand, he will understand the impact of other diseases on the nervous system and on the neurological disease.

Contents

Functional units of the nervous system, symptoms and signs of nervous system diseases, classification of neurological diseases, ways to neurological diagnoses, emergency situations in neurology, chronic neurological diseases, borderline areas between neurology and psychiatry, infectious diseases which have an effect on the nervous system, operable neural diseases, neurological complications of diseases of other systems, treatment of neurological diseases and of pain (pharmacological and other treatments). Rehabilitation in neurology.

Mental Disease (7 ECTS)

Aims

Understanding the psychological, social and somatic factors in the etiology of mental disorders. Psychiatric examination. Diagnostics and classification of mental disorders. Knowledge of the clinical picture and therapeutic treatment of individual disorders. The role of a family physician in treatment of patients with mental disorders. Autonomous action in emergency situations. Holistic treatment in the community. Public health aspects of mental health.

Contents

Symptoms and signs of particular categories of mental disorders. Classification and diagnostic procedure. Mental disorders in neurological and other somatic diseases. Treatment: psychopharmacotherapy and psychotherapy. Rehabilitation and preventive measures.

Digestive Organs (5 ECTS)

Aims

The student will be acquainted with the epidemiology, diagnostics and clinical features of gastrointestinal diseases and imaging diagnostics of mentioned diseases. The student will become familiar with preparation of the patient prior to surgical procedure, with general and regional anaesthesia, and with pain management and resuscitation. After finishing this section, a medical student will be able to treat a patient with the clinical picture of an acute abdomen, with hidden and evident signs of gastrointestinal disease. He will be able to consult other specialists before deciding indication for surgical treatment. He will be able to make a diagnosis with a clinical examination and diagnostic investigations. He will be familiar with differential diagnostics and the principles and methods of treatment and prevention of gastrointestinal diseases.

Contents

The student will become familiar with epidemiology, etiology, pathogenesis, clinical picture, complications, differential diagnostics, gradual diagnostics of these diseases and with interdisciplinary cooperation. He will get familiar with the most common causes of the acute abdomen and he knows the methods of treatment.

He will become acquainted with the basic principles of the surgical treatment of benign and malignant gastrointestinal tract diseases. Students become familiar with the influence of concomitant diseases on the perioperative management, with procedures to improve the patient's general condition prior to surgical procedure, with general, regional and combined anaesthesia, with prevention and management of major complications, and with pain management and resuscitation. The student gets familiar with the principles of radiological diagnostics and interventional radiology.

Skin and Venereal Diseases (6 ECTS)

Aims

The student will get to know the most common skin diseases and venereal diseases and will become aware how to make a stepwise diagnosis of skin diseases from the anamnestic data and examinations. The current ways of treatment of skin and venereal diseases and possible advances in the treatment will be presented. The students will be directed towards the holistic comprehension of the skin and venereal diseases, the influence of the skin diseases on the whole organism, also in psycho-social respect will be stressed. The manifestations and influences of non-dermatological non-musculoskeletal diseases on the status of the skin and musculoskeletal system will be emphasized.

Contents

In the subject, topographic anatomy, physiology and histology of the skin will be resumed. Skin diseases and venereal diseases, the possibilities to state the diagnosis of skin and venereal diseases and the ways of the treatment of skin and venereal diseases, instructions for determining the final state (disability) after the skin and venereal disease and methods for preventing injuries and diseases of the musculoskeletal system and skin and venereal diseases will be presented.

Infectious Diseases and epidemiology (12 ECTS)

Aims

The student will get acquainted with the epidemiology, diagnostics and clinical picture of infectious diseases. He will acquire knowledge about internal and surgical diseases of the gastrointestinal tract, diseases of the blood and blood forming organs, imaging diagnostics of these diseases, pharmacodynamic and pharmacokinetic properties of antimicrobial substances, cytostatics and immunosuppressive medications. The student will become familiar with preparation of the patient prior to surgical procedure, with general and regional anaesthesia, with pain management and resuscitation. He will be able to make a diagnosis with a clinical examination and diagnostic investigations and will be able to consult other specialists. He will be familiar with differential diagnostics, principles and methods of treatment and prevention of infectious diseases, which are caused by microorganisms, diseases of gastrointestinal tract and diseases of blood and blood forming organs.

Contents

Epidemiology, pathophysiology, clinical, imaging, laboratory and microbiological diagnostics of diseases which are caused by microbes. The following contents will be

presented: infections by organ systems, systemic infections, approaches to a patient with the most common symptoms, infections among people with impaired immunity, infections in all age groups, nosocomial infections, important zoonoses and tropical diseases. The clinical approach to the treatment with antimicrobial drugs, mechanisms of microbial resistance to antimicrobial drugs, methods of detection of microbial resistance.

Respiratory Diseases (4 ECTS)

Aims

Student should make a diagnosis of lung diseases from history, clinical examination and laboratory tests, be able to perform emergency treatment in lung diseases, learn the valid principles of treatment and rehabilitation and get information on new treatment modalities, which are in the process of evaluation at the moment. Understand the comprehensive approach to the patient, as lung diseases influence the function of other organs as well, and influences the psycho-social situation of the patient. Moreover, many other diseases influence the function of respiratory system.

Contents

The following specialities participate in the course: Internal medicine (pneumology), Surgery (thoracic), microbiology, Radiology

Outline: Epidemiology of respiratory diseases, pathology, pathophysiology, genetics of respiratory diseases, symptoms and signs of lung diseases, etiology (genetic influences, inborn malformations, degenerative changes, infections, injuries, cancer...) of respiratory diseases, primary and secondary prevention of respiratory diseases, diagnostic procedures and principles of laboratory diagnostics of respiratory diseases, acute respiratory diseases (infections, including tuberculosis), chronic respiratory diseases, pulmonary emergencies (respiratory failure, bleeding, asphyxia), treatment of respiratory diseases (non-pharmacological, pharmacological, rehabilitation, principles of treatment after transplantation), principles of imaging, interventional radiology.

Circulatory System (8 ECTS)

Aims

Student should: make a diagnosis of cardiovascular diseases from history, clinical examination and laboratory tests, be able to perform emergency treatment in cardiovascular diseases, learn the valid principles of treatment and rehabilitation and get information on new treatment modalities, which are in the process of evaluation at the moment. Understand the comprehensive approach to the patient, as cardiovascular diseases influence the function of other organs as well, and influences the psycho-social situation of the patient. Moreover, many other diseases influence the function of cardiovascular system.

Contents

The following specialities participate in the course: Internal medicine (cardiology, hypertension, vascular diseases, intensive care), Surgery (cardiovascular), Radiology, Pharmacology, Anatomy

Outline:

Epidemiology of cardiovascular diseases, pathology, pathophysiology, symptoms and signs, etiology (genetic influences, inborn malformations, degenerative changes, infections, injuries...), diagnostic procedures, acute and chronic diseases of heart and blood vessels, cardiovascular emergencies, treatment (non-pharmacological, pharmacological, interventional, surgical, rehabilitation, primary and secondary prevention of cardiovascular diseases, principles of treatment after transplantation)

Blood (3 ECTS)

Aims

Students get knowledge about pathogenesis, epidemiology, early detection, diagnostics and treatment of hematologic diseases. They learn an approach to patients with hematologic diseases. They are able to establish diagnosis using anamnesis, clinical examination and basic laboratory tests. Interpretation of blood picture is considered as kind of »hematological ECG«.

Contents

Students learn on epidemiology, etiology, pathogenesis, clinical presentation, complications, differential diagnosis, diagnostic approach to diseases of hemopoietic

system and interdisciplinary approach in hematology.

Students get familiar with blood cells morphology. Ultimate goal is to obtain knowledge on the level of general practitioner. Emphasis is on anamnesis, clinical examination, interpretation of blood picture and essential laboratory parameters.

Orthopedics and Traumatology (5 ECTS)

Aims

Students learn about the most common diseases and injuries of the skeleton and the musculoskeletal system, they learn the anamnestic data acquisition and build investigation steps to the diagnosis of disease or injury. They learn emergency medical assistance in these diseases or injuries, the current methods of treatment and the possible future development of the method of treatment. Above all, the student will be directed to holistic understanding of diseases and injuries by emphasizing the impact of diseases and injuries to the musculoskeletal system, the whole psycho-social organism and the impact of diseases outside of the musculoskeletal system on the locomotion.

Contents

Subject consists of two subdivisions

1. Orthopaedics
2. Traumatology

The subject consists of musculoskeletal topographic anatomy review, physical and physiological basic musculoskeletal kinematics, description of musculoskeletal diseases and injuries, treatment options of musculoskeletal diseases and injuries, surgical procedures on patients with musculoskeletal disorders, prevention of musculoskeletal diseases or injuries.

Forensic Medicine (4 ECTS)

Aims

The student will get familiar with the mechanisms of injuries, their classification and their evaluation. He will be able to distinguish between most common intoxications, he will master the basics of forensic hematology and he will be able to recognize all those emergency situations where ethical, criminal and indemnifying responsibility of physician is possible. He will be acquainted with basic forensic medical tasks of general practitioner. He will acquire knowledge about the most important forensic rules and ethical principles necessary for efficiently performing his future profession.

Contents

The student becomes familiar with basics of classical forensic medicine from the mechanisms of natural and violent death to the signs of death. He acquires knowledge about the basics of identification, injury mechanisms and their forensic medical characteristics. He becomes acquainted with physical and gun-shot injuries, suffocations, the basics of forensic toxicology and hematology. He gets familiar with legislation (both health and criminal), with the basics of expert work with special emphasis on assessing body injuries. At the lectures he gets familiar with emergency situations, which

may indicate criminal and indemnifying responsibility. He upgrades his knowledge of moral, ethical and deontological principles regarding the work of physician. The student integrates the knowledge of all preclinical and the majority of clinical subjects, consolidates his knowledge about shock, acquires the basics of physician's work in emergency medicine, he becomes familiar with physician's tasks in the case of infanticide as well as with medical error and iatrogenic injuries. He acquires knowledge about interdisciplinary cooperation in forensic medicine.

Maxillofacial Surgery with Fundamentals of Dental Medicine (3 ECTS)

Aims

The student will become familiar with facial skeleton diseases, diseases of facial soft tissues and diseases of the oral cavity, including basic dental and parodontal tissue diseases. At clinical practical course he will learn how to perform an oral and maxillofacial examination, basics of differential diagnostics and first medical aid.

Contents

Characteristics of facial, oral and neck anatomy which are associated with congenital abnormalities, injuries, infections, tumors, degenerative diseases and aquired facial

irregularities, pre-prosthetic needs of treatment, temporomandibular joint diseases and dental and parodontal tissue dependent pathology. The student gets familiar with etiology, epidemiology, pathogenesis, clinical picture, diagnostics and interdisciplinary treatment of maxillofacial and oral diseases.

Otorhinolaryngology (5 ECTS)

Aims

The student will become familiar with ear diseases, nose and paranasal sinuses diseases, oral cavity diseases, pharyngeal and laryngeal diseases, with diseased changes on the neck, with causes for hearing, sense of smell and taste disorders. At clinical practical course he will learn otorhinolaryngological (ORL) examination techniques, first medical aid, treating an otorhinolaryngological patient and will test his skills in contact with patients.

Contents

Special features of the anatomy and physiology of ear, nasal organ, oral cavity, pharynx, larynx and neck with special emphasis on disease processes in this area. Physiology of hearing, equilibrium, smell and taste. Congenital abnormalities, injuries, inflammations, tumors of the ear, nose and paranasal sinuses, oral cavity, pharynx, larynx and neck. Epidemiology, etiology, pathogenesis, patient's signs and symptoms of ORL disease. Diagnostic procedures in the determination of mentioned pathological conditions, treatment options and efficiency of treatment. Interdisciplinary cooperation.

Ophthalmology (5 ECTS)

Aims

The student will become familiar with eye and ocular appendages diseases and diseases of other organ systems which reflect on eyes or vision. At clinical practical course he will learn ophthalmological examination techniques and will test his skills in contact with patients.

He will acquire knowledge about orbital diseases, intracranial processes that result in loss of vision and with diseases and injuries of the orbit and paranasal sinuses which affect vision. He will also get familiar with specifics of eye diseases among children and with systemic and genetic diseases that affect vision. At clinical practical course he will learn ophthalmological and oriented neuro-ophthalmological examination, basics of differential diagnostics and first medical aid.

Contents

Specialties of anatomy and physiology of eyes, ocular appendages and orbit with special emphasis on disease processes in this area. Physiology of vision and ocular movements. Congenital abnormalities, injuries, inflammations, eye tumors and tumors of the orbit and paranasal sinuses. Epidemiology, etiology, pathogenesis, patient's signs and symptoms. Diagnostic procedures in determining mentioned pathological conditions, possibilities and efficiency of treatment. Interdisciplinary cooperation.

Gynaecology and Obstetrics (9 ECTS)

Aims

The student will become familiar with the physiology of the menstrual cycle, pregnancy, menstrual cycle disorders, with abnormalities in development of female genitals and with gynaecological endocrinopathies. He will get familiar with inflammatory diseases, benign and malignant tumors of the reproductive system and static disorders of the pelvic floor. He will acquire knowledge about reproductive health, hormone treatment, infertility diagnostics and treatment in particular.

At clinical practical course in gynecology the student will acquire knowledge about targeted anamnesis, he will learn to identify irregularities of the menstrual cycle and will become familiar with characteristics of other pathological processes of reproductive organs. He will get acquainted with gynecological examination techniques including Papanicolaou test and bimanual palpation. He will gain fundamental information on non-invasive imaging investigations for identification of basic pathological processes in gynecology. He will monitor basic invasive diagnostic and therapeutic procedures of reproductive system diseases.

The student will become familiar with the physiology of pregnancy, with the course and supervision of a healthy and diseased pregnant woman and her foetus, with the normal

course of labour and with irregularities during labour and postpartum period. He will get acquainted with invasive and non-invasive screening tests and genetic counseling. He will get familiar with different pathological conditions of pregnancy (pre-eclampsia, deep venous thrombosis, diabetes, etc.), with premature birth and with basic problems of neonatal medicine. At clinical practical course in obstetrics the student will acquire knowledge about targeted anamnesis of a pregnant woman, about clinical examination of a pregnant woman and external obstetric investigations. He will get familiar with mandatory examinations during pregnancy and with reproductive health care. He will participate in non-invasive imaging examinations during pregnancy and at genetic counseling. He will monitor the course of a normal labor, instrumental labor and postpartum period. He will participate in the care of a healthy newborn and will get familiar with the treatment of prematurely born infants.

Contents

Specialties of anatomy and physiology of the female reproductive organs, pregnancy and labour with special emphasis on disease processes in this area. Physiology of menstrual cycle. Abnormalities in development of the reproductive system, irregularities in menstrual cycle, gynecological endocrinopathies, different periods of hormonal activity. Reproductive organs injuries, inflammation of reproductive organs, benign and malignant tumors of reproductive organs, static disorders, etiology, epidemiology, pathogenesis, patient's symptoms and signs. Diagnostic procedures, treatments and interdisciplinary treatment. Physiology of pregnancy, infertility, types of treatment and treatment options for infertility. Legal and ethical aspects of reproductive medicine. Reproduction health, treatment with hormones, contraception. Physiology of pregnancy, the normal course of pregnancy and types of control, mandatory pregnancy examinations, monitoring of foetus development, normal childbirth and postpartum period. Non-invasive imaging tests, clinical monitoring of normal and pathological pregnancy. Pathological pregnancy, etiology, epidemiology, pathogenesis, patient's signs and symptoms. Diagnostic procedures, types of treatment and interdisciplinary treatment. Adaptation of a newborn, prematurely born child. Physiology of lactation and lactation disorders, benign and malignant breast diseases; etiology, epidemiology, pathogenesis, patient's symptoms and signs. Diagnostic procedures, types of treatment and interdisciplinary treatment.

Geriatrics, Clinical Nutrition and Palliative Medicine (5 ECTS)

Aims

Content module Geriatrics:

Student should learn the valid principles of treatment and rehabilitation and get information on new treatment modalities, which are in the process of evaluation at the moment. Student should understand the comprehensive approach to the elderly patient, as advanced age influence the function of other organs as well, and influences the psychosocial situation of the patient. Acquire knowledge and skills in the management of a acute/urgent medical illness in older patients. Acquire knowledge and skills in evaluation and management of common geriatric syndromes, including but not limited to delirium, dementia, immobility, malnutrition, poly-pharmacy, pre and post-operative complications, geriatric psycho-social problems, discharge planning, and elder abuse. Acquire experience in evaluation and management of frail elderly patients with multiple acute and chronic illnesses. To understand functional status and how it relates to inpatient geriatrics and discharge planning. Acquire knowledge in running family meetings. To learn how to address end of life decisions with patients and their family members. Acquire knowledge and skills to perform common geriatric tools. Acquire knowledge and skills to perform comprehensive geriatric examination. Acquire knowledge and skills to perform comprehensive geriatric assessment.

Content module Clinical Nutrition:

Understanding of the role and importance of clinical nutrition in medicine. The student is able to perform nutritional risk evaluation and malnutrition with the appropriate tools. The student understands basic links between the dietary intake and metabolic status in health and disease states, with an emphasis on the specific nutritional needs of different population groups and personalized treatment of patients. The student understands and is able to identify cachectic metabolic state. Students is informed of the importance of multidisciplinary and multimodal nutritional treatment of patients.

Content module Palliative medicine:

Students should describe and explain the basic WHO definition of palliative care, use basic palliative care terminology, describe and explain key concepts and principles in palliative care, recognize the course of typical groups of chronic diseases, - describe and distinguish the periods of palliative care, assess the functional status of the patient and assess the prognosis. Describe and apply the criteria for entry into palliative care, - to recognize the individual needs of patients and relatives in their living environments with regard to comprehensive, continuous coordination of care. Identify, assess (grade) and treat the most common symptoms in palliative care (pain, shortness of breath, gastrointestinal symptoms, restlessness, delirium), identify emergency conditions of patients in palliative care and carry out key measures, recognize the period of dying (the last days of life) and adjust treatment accordingly, recognize cultural factors in death and ways of dying; - find resources for additional care of very demanding patients in the last period of life.

Contents

Module 1: Geriatrics

Module 2: Clinical Nutrition

Module 3: Palliative medicine

Participating specialties in this course: Family medicine, Internal medicine, Anaesthesiology, Oncology

Content module Geriatrics: epidemiology of aging, physiology of aging, pharmacology of elderly, geriatric syndromes such as frailty, dementia, incontinence, and falls, presentations of common diseases that are unique in this population, symptoms and signs characteristic for elderly, diagnostic procedures and principles of evaluation of functional and laboratory diagnostic test in elderly, geriatric tools in the context of comprehensive geriatric assessment, comprehensive geriatric examination, comprehensive geriatric assessment, principles of care of acute diseases in elderly, principles of care of chronic diseases in elderly, emergency situations in elderly; Intensive care of elderly, hazards of hospitalization for older adults, assessment of functional status, holistic approach to the older patient in the context of their entire family unit, geriatric rehabilitation.

Content module Clinical Nutrition: Basic concepts of clinical nutrition and definitions of nutritional terminology will be presented. The clinical application of the concepts of energy and protein balance will be demonstrated. The nutritional treatment process will be demonstrated, including the clinical use of body composition measurements. The clinical consequences of the impact of malnutrition and overnutrition on the functioning of the body in healthy and diseased individuals. The impact of cachexia on the course of chronic diseases will be emphasized.

Content module Palliative medicine: definition of palliative medicine & care, team work in a palliative care; multidisciplinary, interdisciplinarity of the team, palliative care as an integral part of the holistic treatment of patients with advanced incurable diseases and support to their relatives, national strategy and development, criteria for palliative care in various chronic diseases, assessment of the needs of the patient and his family, prognostication in palliative medicine, identification, assessment of needs and planning of treatment (physical, psychological, social, spiritual) of patients in palliative care, recognition, assessment and treatment planning of physical symptoms (pain, dyspnoea, nausea/vomiting and delirium), emergency situations in palliative care, ethical dilemmas in palliative medicine the dying period – symptom management, death procedures, communication in palliative care.

Physical and Rehabilitation Medicine with Occupational Medicine (3 ECTS)

Aims

1. Physical and Rehabilitation medicine The aim is to acquire knowledge in the field of physical and rehabilitation medicine, which the student will need in his work as a future doctor. Student will acquire competences for the independent use of knowledge about assessment in rehabilitation medicine, physical methods of treatment, principles of rehabilitation in patients with diseases and injuries of the nervous system and the musculoskeletal system, and assistive technology. The student will also

strengthen the skills of clinical examination of a patient who needs rehabilitation measures.

2. Occupational medicine: The aim of the course is to acquire knowledge in the field of occupational medicine, which the student as a future doctor will be able to transfer to clinical practice. The student will acquire competencies for independent application of knowledge on: occupational diseases, exposures at workplaces and their prevention, ergonomics, professional toxicology, traffic and sports medicine.

Contents

Module 1: Physical and Rehabilitation Medicine

Module 2: Occupational Medicine

Physical and Rehabilitation Medicine: Introduction to physical and rehabilitation medicine, assessment in physical and rehabilitation medicine, physical modalities, rehabilitation of patients with neurological diseases and injuries, rehabilitation of patients with diseases and injuries of musculoskeletal system, assistive technologies

Occupational medicine: Introduction to occupational, transport and sports medicine, exposures at the workplace, occupational diseases, measures to prevent occupational diseases and health impairments, traffic medicine, sports medicine.

Immune Mediated and Rheumatic Diseases (3 ECTS)

Aims

Student should: make a diagnosis from history, clinical examination and laboratory tests, be able to perform emergency treatment in rheumatologic and allergic diseases, learn the valid principles of treatment and rehabilitation and get information on new treatment modalities, which are in the process of evaluation at the moment, understand the comprehensive approach to the patient, as rheumatologic and allergic diseases influence the function of other organs as well, and influences the psycho-social situation of the patient. Moreover, many other diseases influence the function of immune system.

Contents

The following specialities participate in the course: Internal medicine (rheumatology, allergology), Surgery (thoracic), microbiology and immunology (clinical immunology). The subject is divided into sub-subjects: rheumatic diseases, allerology, clinical immunology and other immune diseases

Outline: Epidemiology of rheumatologic and allergic diseases, pathology, pathophysiology, genetics of rheumatologic and allergic diseases, symptoms and signs of rheumatologic and allergic diseases, etiology (genetic influences, inborn malformations, degenerative changes, infections, ...) of rheumatologic and allergic diseases, primary and secondary prevention of rheumatologic and allergic diseases, diagnostic procedures and principles of laboratory diagnostics of rheumatologic and allergic diseases, acute rheumatologic and allergic diseases (infections, including tuberculosis), chronic rheumatologic and allergic diseases, rheumatologic and allergic emergencies (anaphylaxis, temporal arteritis, other systemic vasculitides, septic arthritides), treatment of rheumatologic and allergic diseases (non-pharmacological, pharmacological, rehabilitation), principles of diagnostics and treatment of immuno-compromised patients, managing of a patient before and after organ transplantation).

Urinary Tract diseases (3 ECTS)

Aims

The student will get acquainted with the most common diseases of the kidneys and of the urinary tract. He will develop the ability to gradually make a diagnosis of kidney and urinary tract disorder on the basis of anamnestic data, physical examination and laboratory investigation. He will become able to autonomously provide the emergency medical aid in patients. He will master current methods of treatment and rehabilitation. He will get acquainted with possible future development of treatment and rehabilitation methods. He will acquire holistic understanding of kidney and urinary tract disorders and will become able to recognize the influence of these disorders on the entire organism, also in the psychosocial terms.

Contents

The following specialties are included in this subject: Internal medicine (nephrology, nuclear medicine), surgery (urology), imaging diagnostics.

Detailed contents: Epidemiology of kidney and urinary tract diseases, pathophysiology, pathomorphology, genetics of kidney and urinary tract diseases; symptoms and signs of kidney and urinary tract diseases; etiology of kidney and urinary tract diseases (congenital abnormalities, hereditary factors, infections, degenerative changes, injuries, cancer); prevention of kidney and urinary tract diseases; diagnostic procedures for kidney and urinary tract diseases; principles of laboratory medicine; acute diseases of kidneys and urinary tract (infections, ischemia, vasculopathy); chronic diseases of kidneys and urinary tract (degenerative, malignant); emergency situations in kidney and urinary tract diseases (acute renal failure); kidney and urinary tract disease treatment (non-pharmacological, pharmacological, rehabilitation); principles of diagnostics and treatment in an immunocompromised patient; guiding the patient before and after transplantation; principles of radiological diagnostics, interventional radiology procedures.

Endocrinology (4 ECTS)

Aims

The student will get acquainted with the most common metabolic diseases. He will develop the ability to gradually make a diagnosis of metabolic disease on the basis of anamnestic data, physical examination and laboratory investigation. He will become able to autonomously provide the emergency medical aid in metabolically ill patients. He will master current methods of treatment and rehabilitation. He will get acquainted with possible future development of treatment and rehabilitation methods. He will acquire holistic understanding of metabolic diseases and will become able to recognize the influence of these disorders on the entire organism, also in the psychosocial terms.

Contents

The following specialties are included in this subject: Internal medicine (endocrinology, nuclear medicine), surgery (thoracic). Detailed contents: Epidemiology of endocrine diseases, pathophysiology, pathomorphology, genetics of endocrine diseases, symptoms and signs of endocrine diseases, etiology of endocrine diseases (congenital abnormalities, hereditary factors, infections, degenerative changes, injuries, cancer), prevention of endocrine diseases, diagnostic procedures in endocrine disorders, principles of laboratory medicine in endocrinology, acute and chronic endocrine diseases, complications on other organs in endocrine diseases, emergency situations in endocrine disorders, treatment of endocrine diseases (non-pharmacological, pharmacological, surgical, rehabilitation), principles of imaging diagnostics in endocrine diseases.

Oncology (4 ECTS)

Aims

Students get knowledge about pathogenesis, epidemiology, early detection, diagnostics and treatment of malignant diseases. Students realize general oncological principles, multidisciplinary approach to the patient, specific oncologic history taking, assessment of patient's performance status, diagnostic methods and treatment.

Contents

The following specialties are included in this subject: Tumor biology (carcinogenesis, genetics, immunology), Epidemiology (epidemiology of cancers, risk factors, cancer registries), Screening methods and early detection of cancer, General principles in oncology (levels of oncological health care, TNM classification, multidisciplinary approach to the patients and ethics, statistical methods in oncology). Oncological pathology, Oncological cytology, Laboratory diagnostics (hematologic, biochemistry, tumor markers, molecular and cytogenetic diagnostics), Imaging in oncology (X-ray, ultrasound, computed tomography, magnetic resonance imaging, PET), Radiotherapy (teletherapy, Brachytherapy, radiobiology, radiophysics), Oncological surgery, Medical treatment, Supportive and palliative care, Clinical presentation of common tumors, Oncological and hematological emergencies, complications of cancers and Treatment of pain.

Internal Medicine (16 ECTS)

Aims

Student trainees guided by clinical practice supervisors will be introduced to professional practice on the wards of internal medicine specialties.

Contents

Practice in the reception clinic, practice in internal medicine departments, practice in internal medicine ambulatory clinic, monitoring functional diagnostics and evaluating laboratory reports, writing records of ambulatory patients, writing records of hospitalized patients, treatment planning, participation at consilium, duty service in internal medicine departments, review of patients at ward meetings and seminars.

Paediatrics (12 ECTS)

Aims

Knowledge on pathophysiological, biochemical, electrophysiological and genetic basics of more common diseases and syndromes in paediatric and young adult population, Knowledge and skills in paediatric history and clinical examination with holistic approach to paediatric and young adult population, with theoretical and practical knowledge on normal growth and development, Knowledge on incidence, clinical presentation and differential diagnosis of diseases and syndromes in different age groups, Knowledge on state-of-the-art diagnostic procedures and their modifications related to paediatric population, with special emphasis on laboratory diagnostics, screening, electrophysiology, paediatric imaging including safety issues, molecular genetics, pathology, microbiology, psycho-social context, nutrition, functional examinations including invasive and prenatal diagnostics Knowledge on principles of state-of-the-art therapy with emphasis on different age groups, pharmacotherapy with different therapeutic groups, nutrition counselling, physical therapy and rehabilitation, occupational therapy, logopaedic therapy, principles of psychotherapy, and critical appraisal of the therapeutic approach with follow-up Knowledge on principles of preventive paediatrics and follow-up of healthy population, vaccination, and school-medicine Knowledge on principles of quality assurance in paediatric care

Contents

Syllabus comprises of paediatric history taking and clinical examination including neurological exam, general and social paediatrics, preventive measured and follow-up of toddlers, children, adolescents and young adults, normal growth and development, neonatology, paediatric cardiology, paediatric haematology and oncology, paediatric neurology, paediatric nephrology, paediatric pulmonology, paediatric infectious diseases, paediatric immunology and rheumatology, paediatric gastroenterology, hepatology and nutrition, paediatric endocrinology, diabetology and metabolism, clinical genetics, paediatric intensive therapy, paediatric surgery, paediatric imaging, laboratory techniques, paediatric and adolescent psychiatry, psychology, and ethics. All paediatric subspecialties are studied and learned in the frame of holistic paediatric approach to the whole family that includes aetiology, pathophysiology, pathology, laboratory diagnostics, medical imaging, medical technology, clinical pharmacology, treatment, follow-up, team approach and reintegration in to the society.

Surgery (11 ECTS)

Aims

Under mentor's supervision student will perform all the medical procedures on working positions of all surgical specialties.

Contents

Practice in admission departments, practice in the emergency department, practice in check-up departments, assistance at large surgeries, outpatients' surgery, writing of medical records for inpatients and outpatients, treatment planning, participation at conciliary meetings, being on duty in emergency departments, review of patients at ward meetings and at multimedia conferences.

Family Medicine (12 ECTS)

Aims

FAMILY MEDICINE: To teach students patient-oriented, generalist approach to consultation and patient management

To teach students how to deal with complexity, multimorbidity and uncertainty

To get students to appreciate the variety and complexity of FM/GP and value long-term interpersonal connections with patients-

PHYSICIAN AND SOCIETY: Teaching about professionalism, the role of a physician in a healthcare system and society and Quality and safety assurance in family medicine

SUBJECT-SPECIFIC COMPETENCIES: Clinical skills targeted to the first contact of the patient with the health service, communication and the relationship between patient and doctor, Management of a multimorbid and complex patient, Facing diagnostic uncertainty, Prevention and health promotion, Cooperation with the local environment, Basics of organization and business.

Contents

The course will cover the following content: Definition of Family Medicine, Diseases and Conditions (Back pain, Chest pain, Pain as a symptom, Acute respiratory infection, urinary tract infections, Arterial hypertension, Diabetes, Obesity, Depression, Dementia, Alcohol consumption, Persistent physical symptoms, Obstructive sleep disorder), Organization of Healthcare (Healthcare system, Community-oriented healthcare, Clinic organization, Rural medicine, Patient rights, Modern technologies), Communication (Principles of communication, Conducting consultations, Breaking bad news, Counselling), Specific Techniques (Decision-making, Home care, Referrals, Prescribing medication, Patient care documentation, Emergency medical care), Comprehensive Care (Principles of prevention, Preventive programs, Lifestyle, Aging, Palliative care, Multimorbidity), Community-Oriented Care (Family, Domestic violence, Healthcare for vulnerable populations), Quality Assurance (Evidence-based medicine, Work supervision, Professionalism).

Anesthesiology and Intensive Medicine (3 ECTS)

Aims:

The aim of the course is to present the importance of optimal preoperative patient's condition, emphasize the importance of cooperation between physicians of different specialties. Students are familiarized with different anesthetic techniques, intraoperative control of the patient, early postoperative surveillance and the importance of treatment in the intensive care unit.

They learn how to use hemodynamic monitoring and the treatment of a hemodynamically unstable patient and a patient in respiratory distress. They know how to use supra glottic and become familiar with the use of infra glottic devices to maintain the airway and the basics of controlled breathing. They become familiar with the basics of acute pain relief and the use of analgesics.

Contents

Presented topics will be: Optimization of patient's medical condition, Elective and urgent procedures, Interdisciplinary cooperation, Anesthesia technique, General anesthesia, Regional anesthesia, Postoperative control, treatment in Intensive care unit, Surgical treatment and anticoagulant and antiaggregative drugs, Transplantation activity
